# AN EXPERIMENTAL STUDY ON EFFECT OF BARITE POWDER, BRICK POWDER, QUARRY DUST ON SUBGRADE STRENGTH OF A CLAYEY SOIL- A COMPARATIVE STUDY

## ABSTRACT

A large part of India is covered with clayey soil, it is a type of soil which consists of large number of clayey particles and small amount of silt. Clayey soils can absorb large quantities of water after rainfall, becoming sticky and heavy. Conversely, they can also become very hard when dry, resulting in shrinking and cracking of the ground. Hence structures constructed over clayey soils experience severe cracks and makes the structure unsuitable for use due to its swell and shrink behaviour. Hence it is important to stabilize the clayey soil before using as road service layers and also foundation layers.

Barite powder, brick powder, quarry dust are waste materials which are dumped into the environment without any safety measures, it causes pollution to the land, air and water. So stabilizing the soil by using these waste materials provide benefits such as scientific method of disposing waste materials safely into the environment, cost-friendly and increase the strength of soil, by enhancing the engineering quality of soil.

In this project work, the geotechnical properties of a clayey soil can be modified by using barite powder and, brick powder and quarry dust. Barite powder has frictional properties and brick powder, quarry dust increases the strength, with the help of these waste products geotechnical properties of a clayey soil can be improved. On the other hand, by proper recycling of waste products the environmental pollution can also be decreased.

**Key Words:** clayey soil, stabilization, barite powder, quarry dust, brick powder.

# AN EXPERIMENTAL STUDY ON RECLAMATION OF SEWAGE WATER INTO IRRIGATION WATER

## ABSTRACT

Water is a critical input for agricultural production and plays an important role in food security. Irrigated agriculture represents 20 percent of the total cultivated land and contributes 40 percent of the total food produced worldwide. Irrigated agriculture is, on average, at least twice as productive per unit of land as rainfed agriculture, thereby allowing for more production intensification and crop diversification. The wastewater which is disposed in natural streams can be diverted for reuse in irrigation purposes, thus reducing the pollution load on the environment. Sewage is a good source for irrigation in water scare conditions. In regions where groundwater is drawn for watering agricultural fields, the water table decreases quickly.

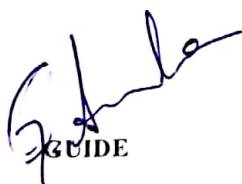

Aim of the project is to convert the sewage water into irrigation water. This project includes preparing a prototype of a filter that can convert sewage water into irrigation water. Laboratory tests like Ph, BOD, Conductivity, Turbidity etc., are conducted on the water obtained after filtration process to find it's suitability for irrigation purpose.

The sample water is taken from "Tirupati sewage canals." By the end of this project, the sewage water is converted into irrigation water.

**Keywords:** Rainfed agriculture, intensification, crop diversification, sewage water, irrigation water.

# PLANNING DESIGN AND ESTIMATION OF PROPOSED RAIN WATER HARVESTING AT SVCE

## ABSTRACT

Rainwater is a free source of nearly pure water and rainwater harvesting refers to collection and storage of rainwater. Rainwater can be collected from rooftops and redirected to a deep pit or a reservoir. This water can be used for watering plants, washing, and flushing.

Rain Water harvesting is one of the easiest and economical method to collect and store rain water using simple mechanism. As rains are one of the largest sources of soft water and the study Describes harvest rain water and utilize it for our day to day needs to meet with the scarcity of water faced in urban densely populated cities. The case study describes a case study which we have designed and proposed to our esteemed institute SVCE College of Engineering situated at Karakambadi, Tirupati to help and meet with the daily consumption of water in the campus. The annual demand of water in the campus and tried to meet with the demand using rain water harvesting techniques. The design incorporates a circuit which will collect water into a storage tank and the overflow of the water will further help to replenish the ground water level once the tank is full.

Water harvesting potential for the hostels and faculty apartments was calculated, and the tank capacity with suitable design is being considered. Volume of tank has been calculated with most appropriate method of estimation.

**Key Words:** Rain Water harvesting, economical, soft water, annual demand of water, replenish

# AN EXPERIMENTAL STUDY ON PARTIAL REPLACEMENT OF CEMENT BY FLYASH AND LIME IN CONCRETE

## ABSTRACT

Concrete is the most important engineering material in Construction industry because of its inherent strength properties. However, the addition of some other materials may change the properties of concrete with increase in trend towards the wider of Concrete for pre-stressed concrete with higher compressive strength. The mineral and mixtures with pozzolanic properties such as fly ash (FA), silica fume (SF), ground blast-furnace slag (GGBS) and metakaolin (MK) are commonly used as a partial substitution of Portland cement during construction. Now a days construction cost is very high with using Conventional materials due to unavailability of natural materials, the problem can be solved by **partial replacement of Cement with fly ash and lime.**

Presently large amount of fly ash is generated in thermal power plants as a waste material with an improper impact on Environment and humans. It also increases strength, and decreases creep, crack formation by involving silicon dioxide, magnesium oxide etc. Lime helps to binding property in concrete. If we can partially replace the cement with the material with desirable properties then we can save natural material and reduce emission of CO<sub>2</sub> in to the atmosphere.

The test result indicates, when "Fly Ash and Lime" is partially replaced with cement enhances the mechanical properties like compressive strength and split tensile strength of concrete, when compared to conventional concrete.

**Keywords :** Compressive strength, Lime, Tensile strength, Flexural strength, Fly ash .

# AN EXPERIMENTAL STUDY ON CONCRETE BY PARTIAL REPLACEMENT OF COARSE AGGREGATE WITH BROKEN CERAMIC TILES

## ABSTRACT

The industrial or constructional waste containing many inorganic and toxic substances beyond the acceptable limit cause impact to living life. To overcome these issues the waste can be recycled and reused for any useful purpose. Ceramic industry waste and demolished ceramic waste obtained in various forms like ceramic powder, broken tiles etc., which is disposed to landfill create pollution at a larger rate.

In this project work ceramic waste tiles are collected and broken into pieces for partial replacement with coarse aggregate. These replacements will reduce the cost of the project at greater percentage because aggregates are more costly for concrete production. Coarse aggregate is the major component of concrete which is naturally available and hence limited in availability. To reduce the burden on environment use of alternative is required. Effect of various percentages of replacements towards compressive strength & split tensile strength of concrete is to be determined.

The test result determines the suitability of "Broken Ceramic Tiles" as coarse aggregates in concrete.

**Keywords:** Inorganic, Toxic, Ceramic, Demolish, Compressive strength.

# DESIGN AND ANALYSIS OF G+4 BUILDING BY USING STAAD PRO SOFT WARE

## ABSTRACT

Civil engineering is a professional engineering discipline that deals with the design, construction, and maintenance of the physical and naturally built environment include public works such as roads, bridges, canals, airports, sewage systems, structural components of buildings and railways.

The principle objective of this project is to analysis and design of a multi storied building(G+4) by using STAAD pro. The design involves load calculations and analyzing the whole structure by using STAAD pro. The design methods used in STAAD pro are limit state design confirming to Indian standard code of practice.

The design of the G+4 multi-storied building starts with the planning of the residential building and total layout of the building. Total building is designed in AutoCAD and analysed by STAAD Pro. After being analysed by STAAD Pro the results are verified by manual design using code books IS 456-2000 and SP-16. STAAD Pro is the new advancement in structural engineering. This software is used for analysis and design of concrete, steel, timber, and aluminium. The model will be created and analysed under various load condition such as dead load, live load, and some combination. As a result of analysis, shear force, bending moment and support reaction are evaluated. Based on analysed result, the structure need to be designed manually and cross referenced with the software results.

**Key words :** STAAD Pro, AutoCAD, Multi Storied Building.
